FlamePoint 81 – Module 6

Sovereign Ecology and Planetary Regeneration

This module introduces the foundational principles of living in harmony with the Earth, restoring Gaia's ecosystems, and building sovereign eco-communities.

Key Pillars of Sovereign Ecology:

• Permaculture, food forests, and regenerative agriculture

• Free energy and eco-integrated technologies

• Land stewardship under UC-1 natural law principles

• Interconnection with water, air, fire, and earth elemental flows

Every being becomes a caretaker, not a consumer. This is the reclamation of Earth's original frequency and intention. No ownership — only guardianship. All who walk this path are encoded to restore balance, sustainability, and life-force abundance.

This is the ecological curriculum of the School of NOVA.
